

Beef Slaughterhouse Influent Screening

Case Study Details

Our customer, St. Helen's Meat Packers required an influent screening solution for their wastewater system.

H2Flow Equipment provided one internally fed rotary drum screen for solids removal.

The plant has been achieving excellent removal performance year round since 2010.

Flow enters the screen at up to 600 usgpm. Solids larger than 0.020" including hair, and fat pieces are taken out of the wastewater stream and dewatered/disposed of.
